

An underwater photograph showing a large school of fish swimming in the upper portion of the frame against a light blue background. Below them, the seabed is covered with a dense, textured bed of mussels or similar bivalve shells, extending to the bottom of the image.

ECOSYSTEM/HABITAT RESTORATION AND FISHERIES MANAGEMENT

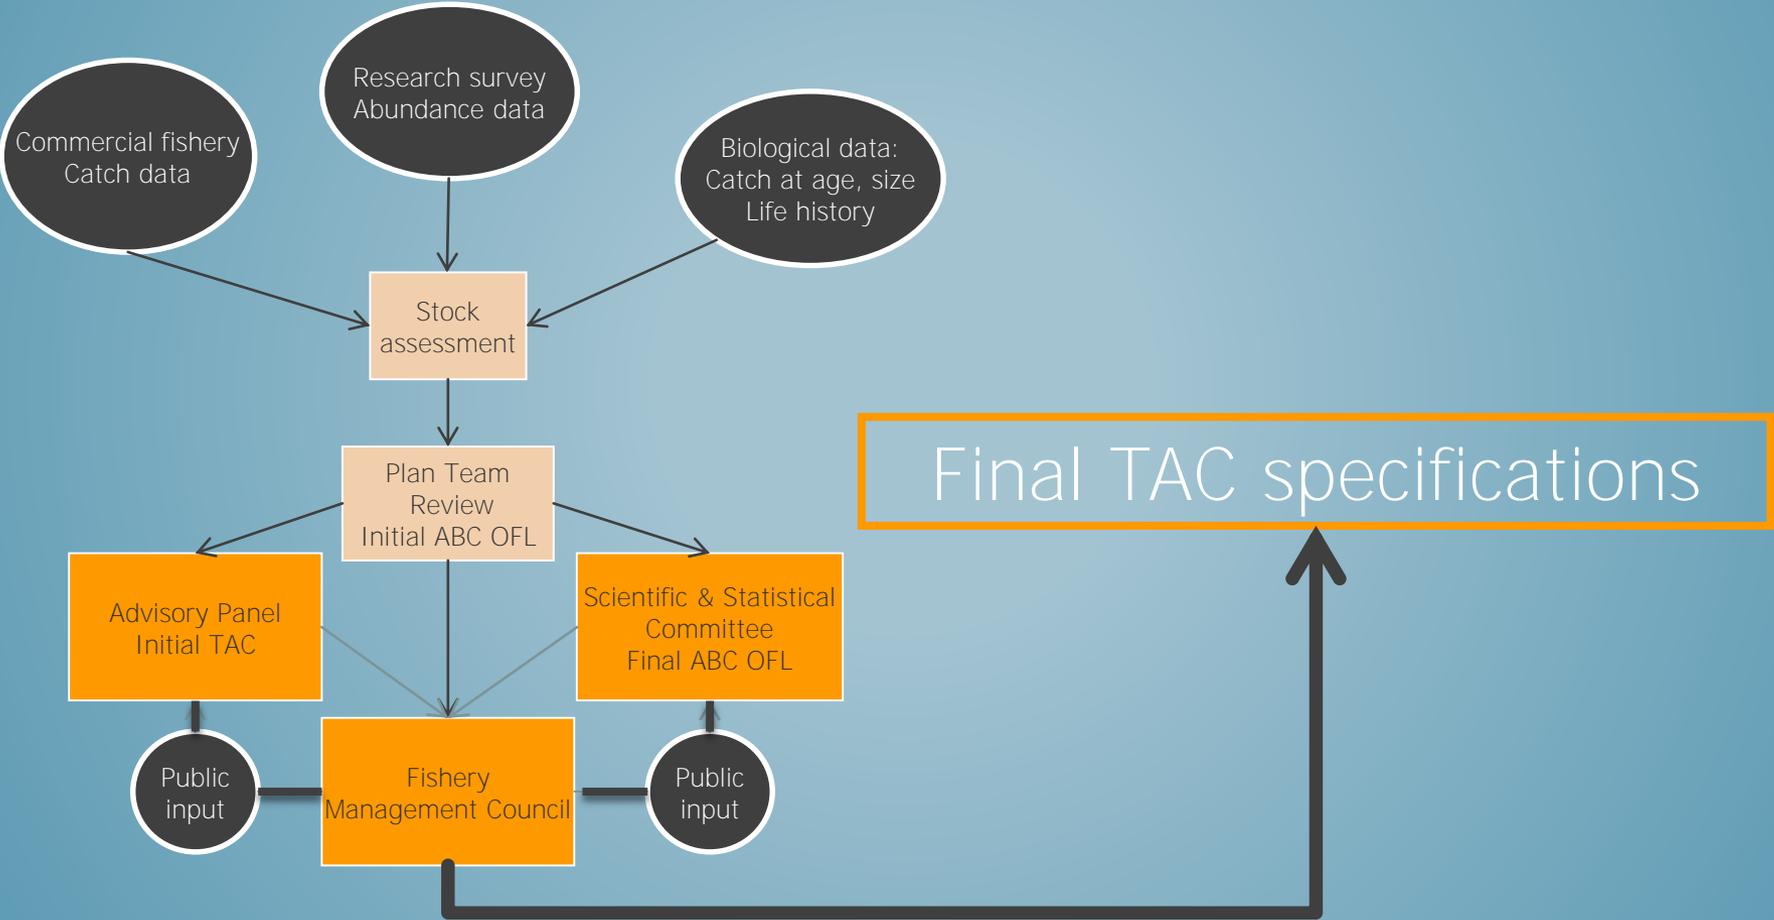

Howard Townsend

Marine Ecosystems Face Many Pressures

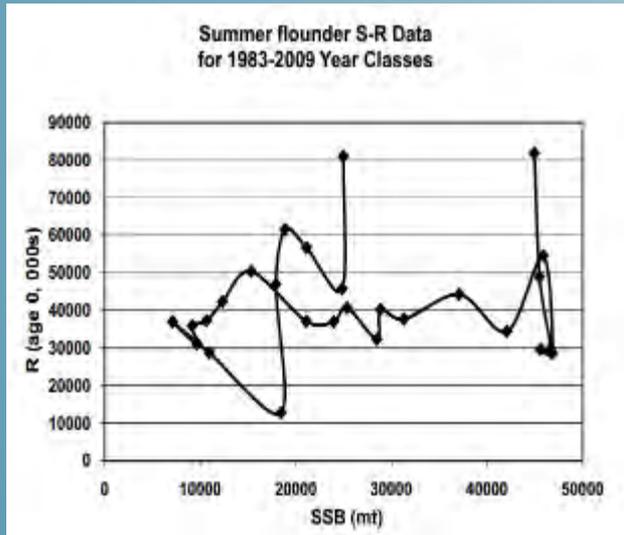

Fisheries Management process

$$Z = F + M$$

M=0.2

Population model equations

(T2.2.1)
$$N_{t,a} = E \left[\frac{\sigma_{t-1}}{a-1} Z_{t,a} + Y_{t,a} \right] ; Y \sim N(0, \sigma_Y^2)$$

(T2.2.2a)
$$N_{y+1,a+1} = N_{y,a} e^{-Z_{y,a}}$$

(T2.2.2b)
$$N_{y+1,0} = N_{y,0} e^{-Z_{y,0}} + N_{y,0} e^{-Z_{y,0}}$$

(T2.2.3)
$$\bar{w}_y = \sum_a N_{y,a} w_a$$

(T2.2.4)
$$Z_{y,a} = M + F_{y,a}$$

(T2.2.5)
$$F_{y,a} = \epsilon_y f_y w_a$$

Catchability model equations

(T2.2.6) *Waka model*

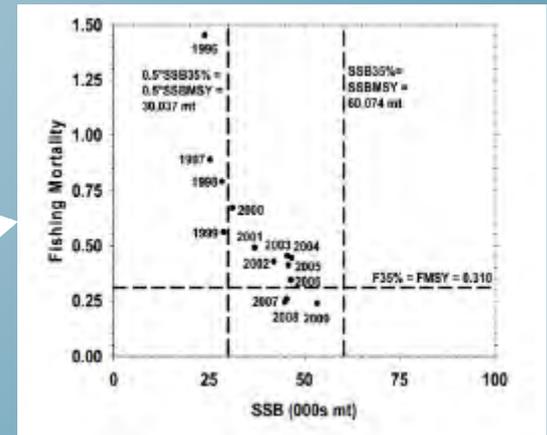

$$\log_e \epsilon_{y,f} = \log_e \bar{w}_f + \alpha_y \epsilon_{y,f} - N(0, \sigma_\epsilon^2)$$

(T2.2.7a) *First order autoregressive*

$$\log_e \epsilon_{y,f} \sim N \left(\log_e \bar{w}_f \frac{\sigma_\epsilon^2}{1 - \rho^2} \right)$$

(T2.2.7b)
$$\log_e \epsilon_{y+1,f} = \log_e \bar{w}_f + \rho (\log_e \epsilon_{y,f} - \log_e \bar{w}_f) + \epsilon_y$$

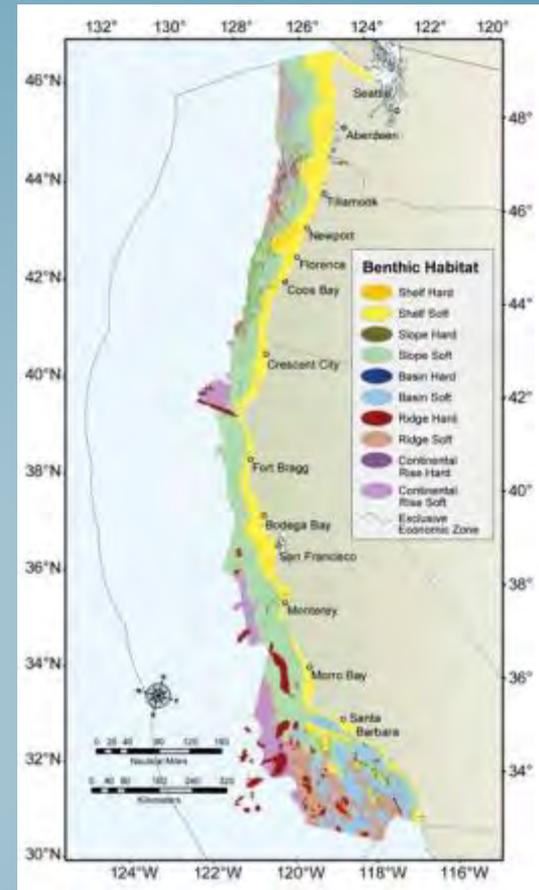

$$\epsilon_y \sim N(0, \sigma_\epsilon^2)$$

SWFSC

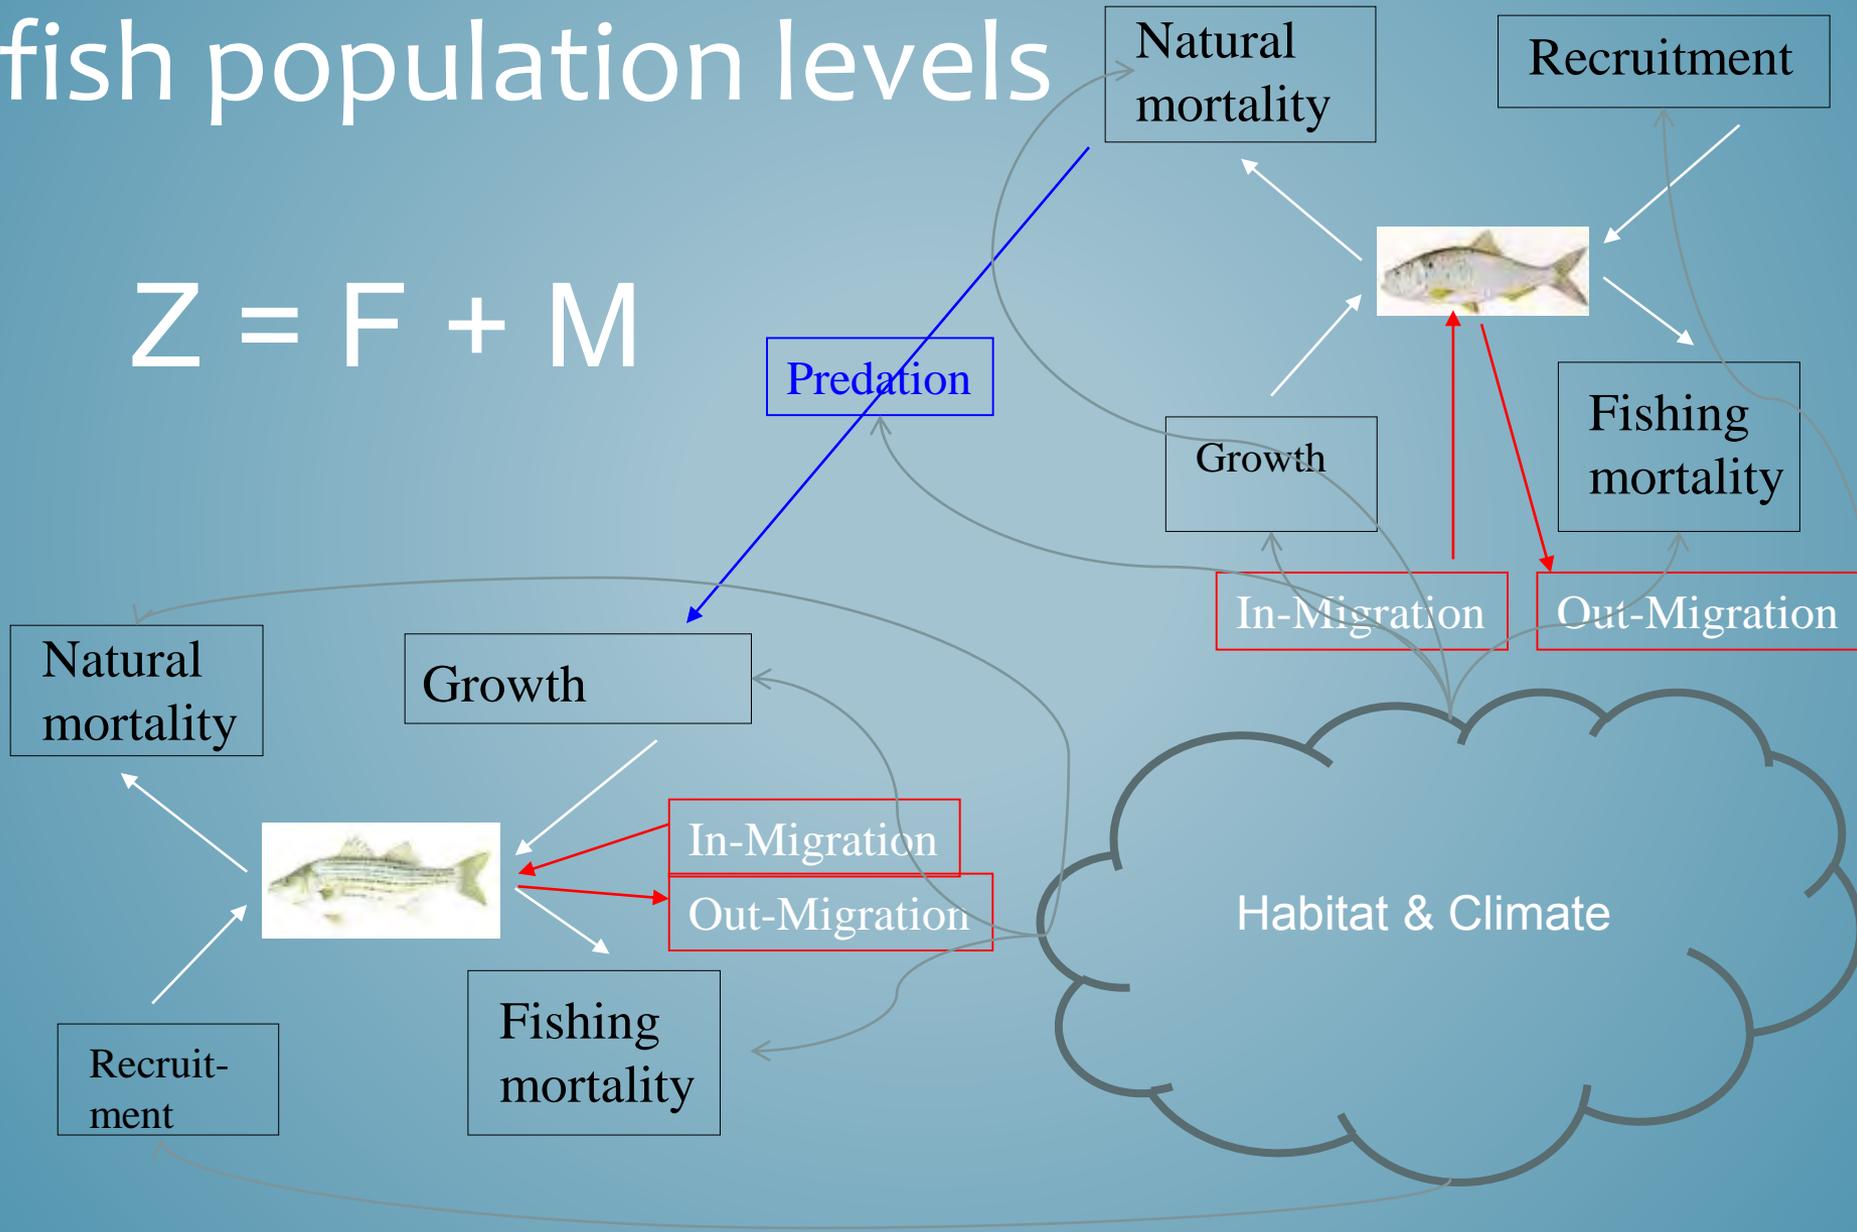

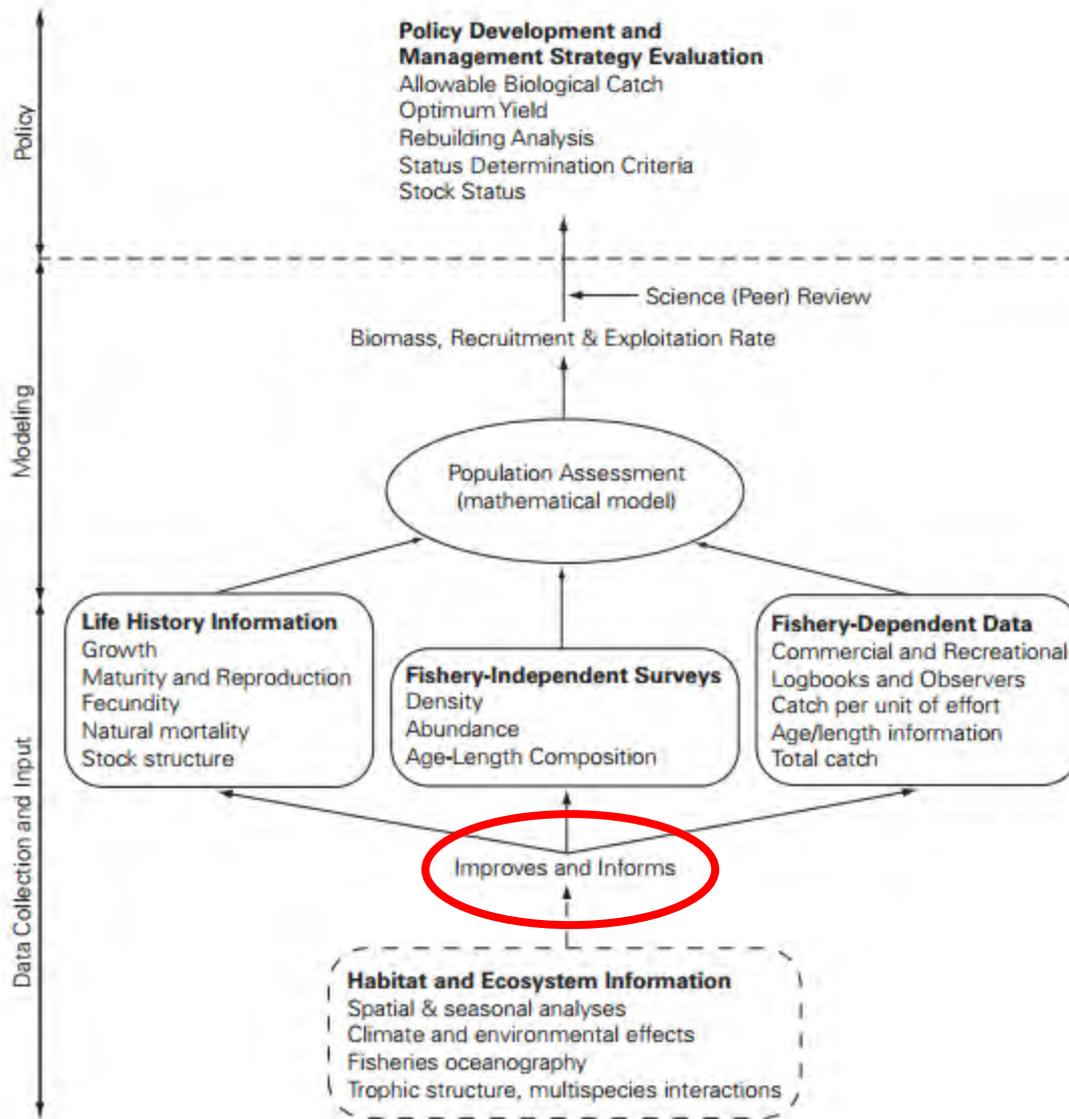

Habitat includes the physical, chemical, biological, and geological components of both benthic and pelagic realms.

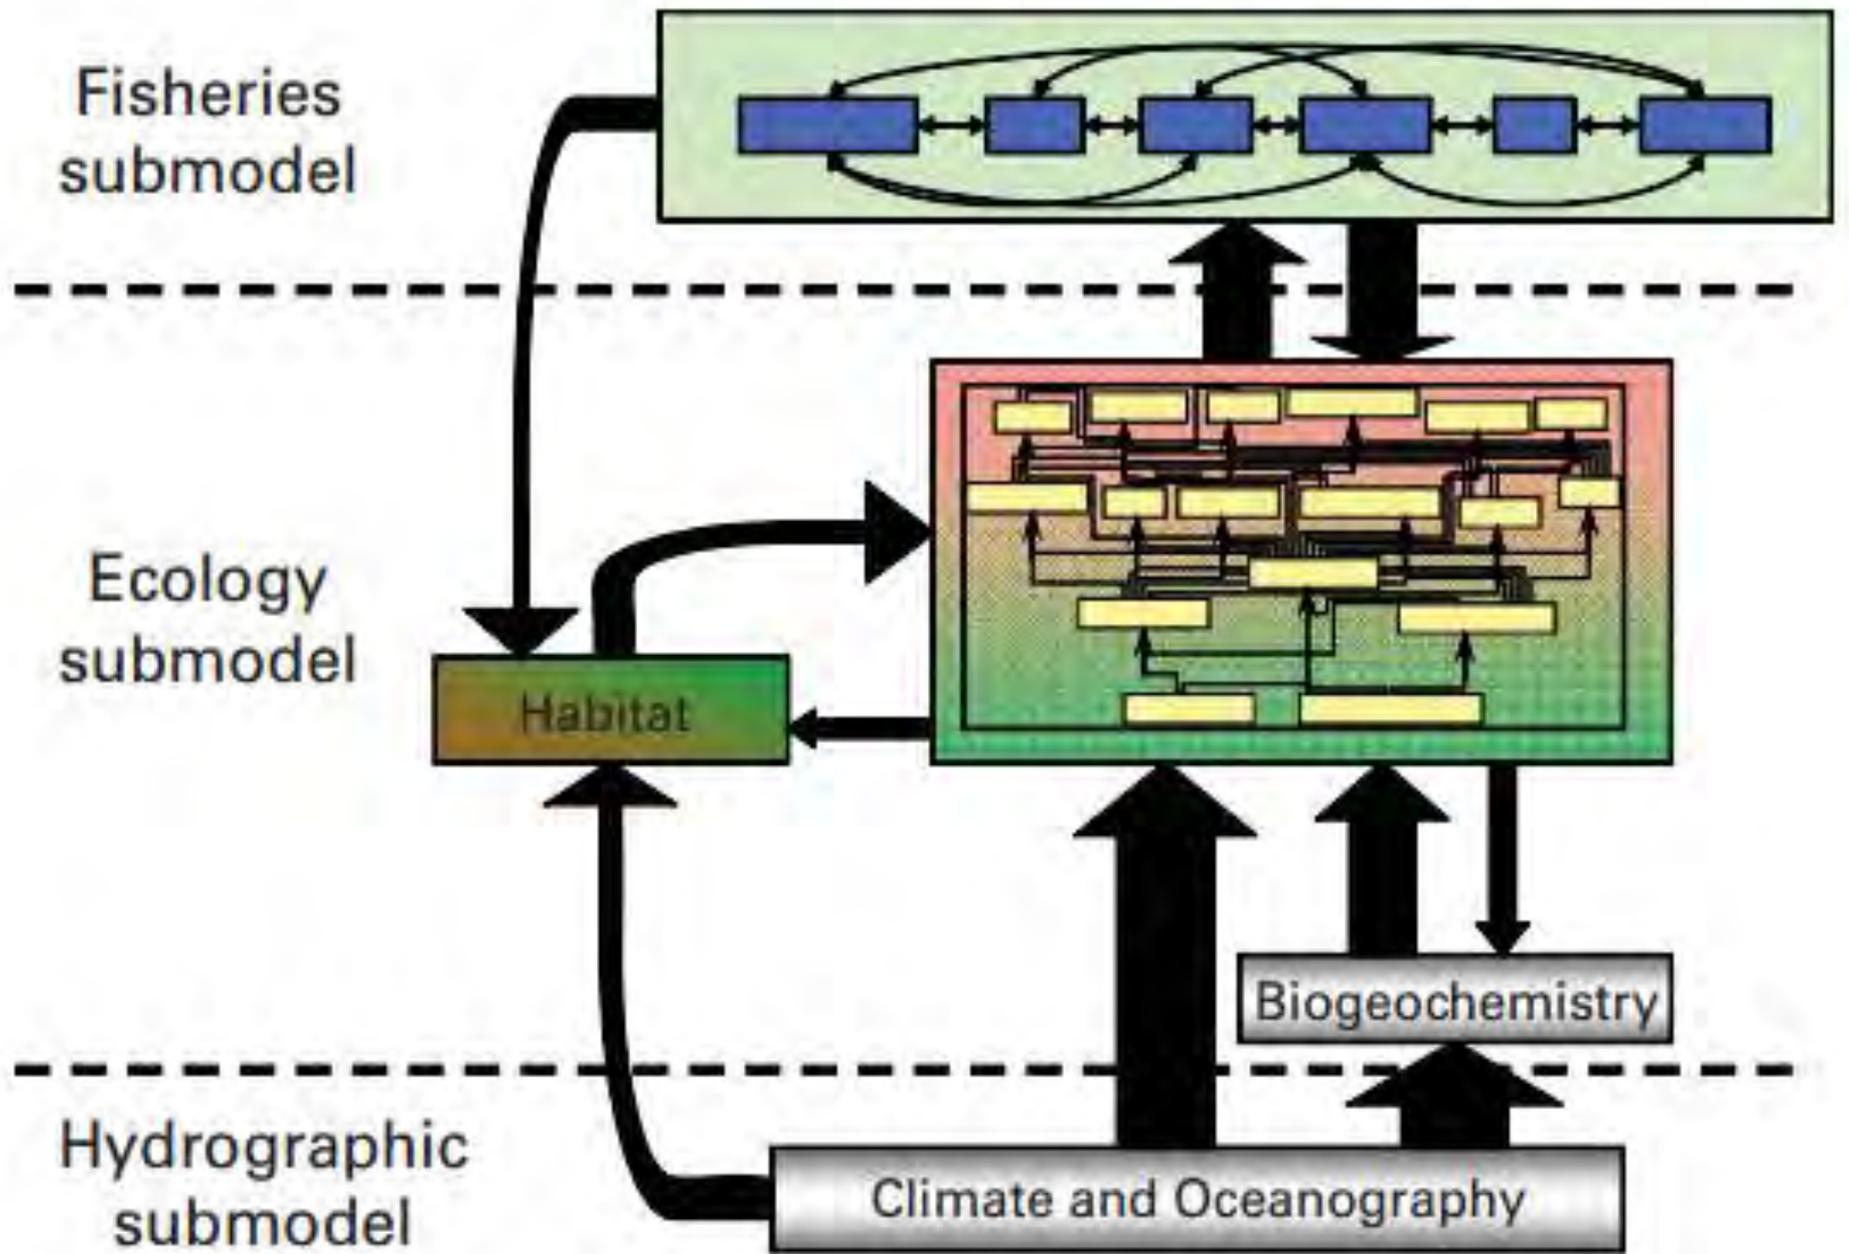

Processes that control fish population levels

$$Z = F + M$$

Levels of Marine Ecosystem Management (Fisheries)

1) **Ecosystem-Based Management (EBM)**

multiple ocean use sectors are discussed and strategic decisions made as to various tradeoffs among sectors

2) **Ecosystem-Based Fisheries Management (EBFM)**

has facets of both strategic & tactical decisions solely within the fisheries sector

3) **Ecosystem Approach to Fisheries (EAF)**

adds ecosystem factors into fisheries stock assessments for tactical management decisions

Levels Of Ecological Model Use To Inform LMR Management

Heuristic

- Understanding Ecosystem Functioning
- Relative Importance of Different Processes
- Advancing Scientific Theory

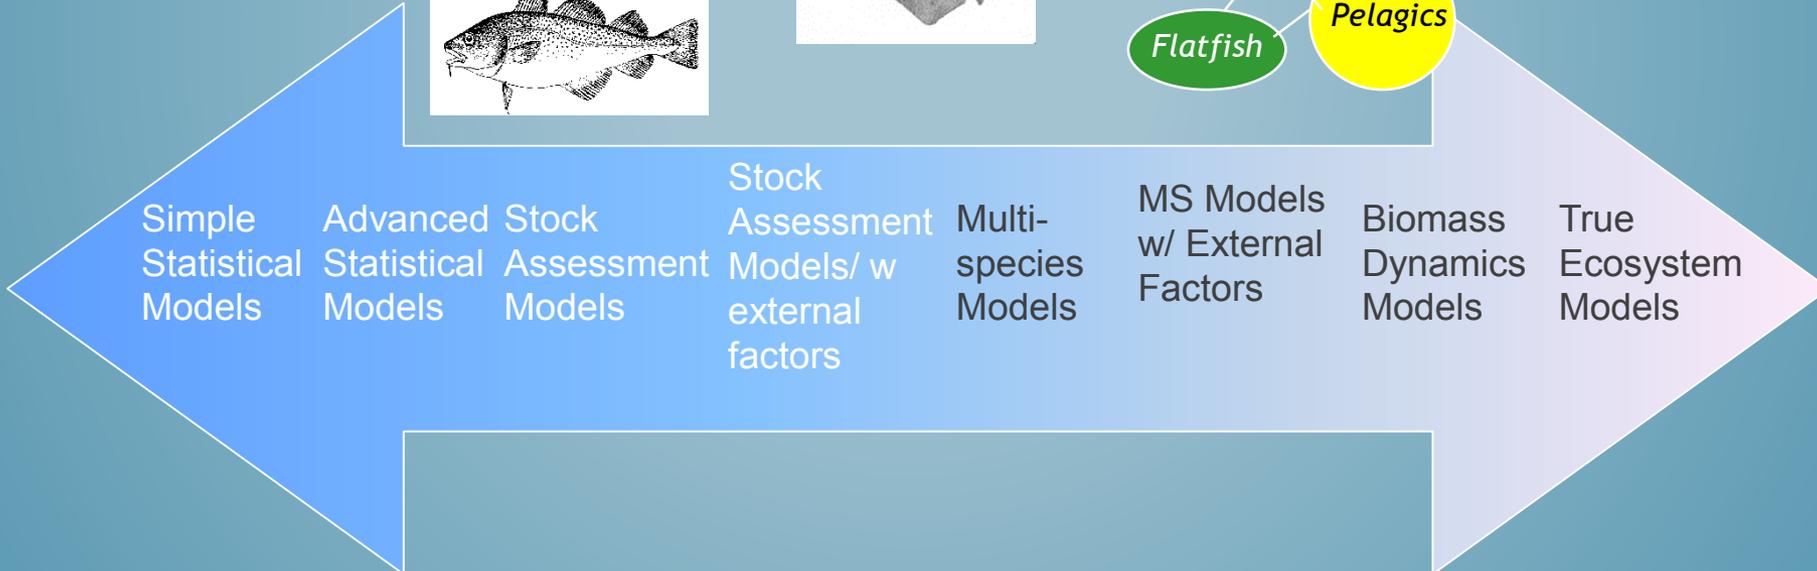

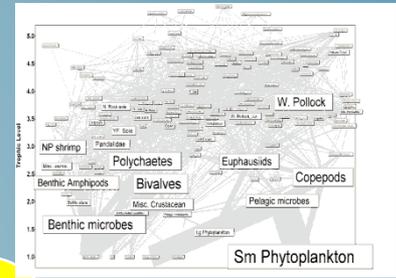

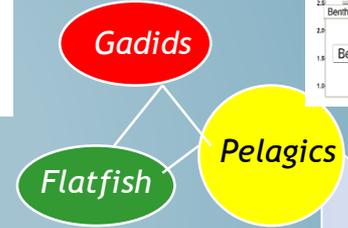

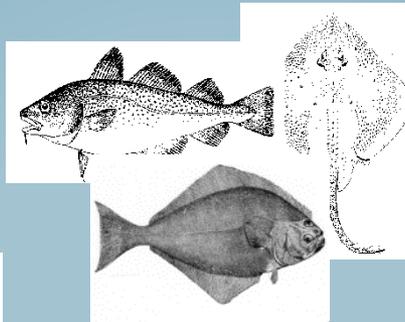

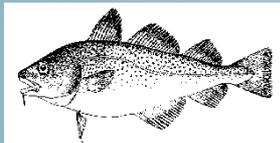

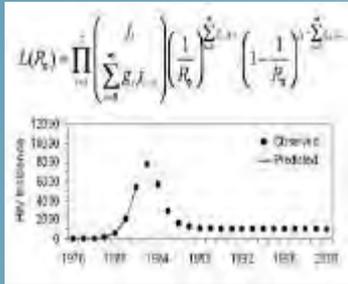

Strategic

- Assessing Biomass Tradeoffs
- System Level Emergent Properties & RPs
- Evaluating Alternate Stable States
- Cumulative Impacts on Non-Target Species, Habitat
- General “What If” Scenarios and Gaming, Long Term Trends
- Time-scale: Decades

Tactical

- Revised Stock Assessments
- Yield Adjustments
- Altered Biological Reference Points, etc.
- Specific Impacts on Non-Target Species, Habitat
- Specific “What If” Scenarios and Gaming
- Time-scale: 1-5 years
